Jennifer Weir

jenniferp.weir@gmail.com | 1.586.904.4127 | github.com/jennweir | linkedin.com/in/jennifer-weir

Platform Engineer specializing in Red Hat OpenShift Container Platform, Kubernetes administration, and GitOps CI/CD automation. Adept at implementing enterprise architecture to scale cloud-native technologies via Infrastructure as Code (IaC) across GCP baremetal environments, while delivering proactive platform support and translating technical concepts during global conference engagement.

CERTIFICATIONS

- **Certified Kubernetes Application Developer (CKAD)** | ID: LF-uxvib0muyw Expires: Oct 2028
- **Red Hat Certified System Administrator in OpenShift** | ID: 260-032-867 Expires: Apr 2029
- **Red Hat Certified Developer in Cloud-Native Applications** | ID: 260-032-867 Expires: Mar 2029

PROFESSIONAL EXPERIENCE

Kubernetes Platform Engineer | Ford Motor Company | Dearborn, MI **July 2024 – Present**

- Engineered OpenShift platform type “baremetal” Tekton build pipeline to drive the deployment of hyperconverged edge clusters operating critical infrastructure in datacenter and plant environments
- Architected scaffolding to standardize per-cluster Terraform module requirements, eliminating configuration drift, removing manual cluster build steps, and accelerating cluster time-to-market
- Streamlined both GCP installer-provisioned and platform type “none” user-provisioned on-prem OpenShift cluster build processes, leading every new build (100+ clusters) since joining the team
- Spearheaded multiple initiatives to reduce tech-debt via 100+ node firmware upgrades, 40+ in-place baremetal node replacements, cluster decommissions, and removal of 1,000s+ Terraform resources
- Delivered proactive support to 100s of developers via meetings and documentation posts to navigate application migrations from on-prem PCF to GCP OpenShift PaaS, VMware to OpenShift Virtualization, enterprise-wide GCP architecture restructuring, and new OpenShift feature adoptions

Software Engineer Intern | Ford Motor Company | Dearborn, MI **May 2023 – July 2023**

- Pioneered the development of a proof of concept for automated GUI validation, leveraging Selenium and Cucumber to implement behavior-driven unit tests against a SaaS insurance product
- Authored a whitepaper showcasing the POC, which outlined strategic misalignment via data-driven documentation and directly influenced leadership's decision to reject adoption of the SaaS product

Systems Test Engineer Intern | Northrop Grumman | Palmdale, CA **June 2022 – August 2022**

- Refactored mission planning software systems by optimizing legacy VBA code to improve the UAV pilot experience, decreasing route generation program errors and increasing vehicle flight accuracy
- Certified by Jet Propulsion Laboratory to solder PCBs & wires for spacecraft electronic assemblies

CONFERENCE SPEAKING & ADVOCACY

- Robust CI as a Safety Net: Moving Fast at Scale with AI-Generated GitOps | KubeCon NA 2026
- Young? First-Gen? Female? New? Here’s Why You Belong Here Too | KubeCon NA 2025
- The Path to Passwordless | CyberArk Workload Identity Day Zero 2025
  “How Ford Secured its Software Supply Chain with Workload Identity Federation (WIF)”

EDUCATION

Penn State University | World Campus **January 2026 - Present**

Masters in Computer Science, Concentration in Distributed Systems and Cloud Computing
Notable Coursework: Distributed Systems, Large Scale Systems, Machine Learning Systems, Big Data

University of Michigan | Ann Arbor, MI

Bachelor of Science in Computer Science, Minor in Complex Systems
Notable Coursework: Operating Systems, Web Systems, Software Engineering, Computer Organization

PROJECTS

HomeLab | github.com/jennweir/homelab **2024 - Present**

- Architect, build, and maintain bare-metal Kubernetes clusters for learning Cloud Native technologies
- Deployed user-provisioned, platform type baremetal OKD cluster on refurbished desktop computers

k8s-gitops-ci | github.com/ArthurVardevanyan/k8s-gitops-ci **2026 - Present**

- Co-developed an automated, open-source GitOps CI validation engine incorporating kubeconform schema checking, markdownlint, shellcheck, and kustomize builds to proactively prevent state drift
